

KEHA Clean Water Program

Bucket Water Filter

Water is one of the most precious natural resources that we often take for granted. Water makes up about 60 percent of your body weight. In order for our body to function properly, average intake for adult women is 8-9 cups per day in order to replenish the water we lost.

But in some countries drinking water make them sick and shortened their lives due to the presence of bacteria and parasite in their drinking water.

Zero Point One Bucket Water Filter will take care of the bacteria and parasites in the water and turn it into potable drinking water. The bucket water filtration system can filter up to 700 gallons water per day and the company guarantees the filter up to 1 million gallons of water.

KEHA is supporting the clean water needs in the Philippines and to any country with the urgency of clean water supply. We have a Filipina Homemakers club that will distribute the filters in the Philippines and demonstrate the use and care for the filter for sustainable viability.
